

AI Workflow Cost & Capacity Test

ORNL Brand Agent V2.3.2 | Test 01: heavy-duty EV graphic draft
Model: GPT-5.6 Sol | Thinking: Light (lowest effort)

One run used 4% of one user's monthly allowance, limiting capacity to 25 comparable runs per month.

20 CREDITS PER RUN	\$0.80 DISPLAYED ESTIMATE PER RUN	4% OF 500 MONTHLY CREDITS	25 MAX RUNS PER USER PER MONTH
-----------------------	--------------------------------------	------------------------------	-----------------------------------

Monthly capacity assumes all 500 credits are available for this workflow. A 50% reserve leaves capacity for 12 full runs.

Observed result

CONCEPT GENERATED QA follow-up needed	The run communicated the intended visual direction. Exact-copy and logo-like material still required correction after one repair. For standardized measurement, this run is recorded as 0 quality-assurance-passing outputs.
---	--

Leadership interpretation

Capacity: 20 credits per run limits one user to 25 comparable runs per month - before any other credit-consuming work.	Quality: The concept was useful, but it still required production cleanup. Continue tracking quality-assurance-passing outputs.	Use: Compare repeated tests by credits per run, monthly capacity, elapsed time, and quality-assurance pass rate.
--	---	--

Standard scorecard for future tests

REPORT EVERY TIME	STANDARD CALCULATION OR RULE	THIS TEST
Run boundary	One fixed task from submission through final stop, including model retries or repairs	1 generation + 1 repair
Measured cost	After value minus before value; report only the delta	20 credits / \$0.80
Allowance share	Credits per run divided by 500	4%
Monthly capacity	Floor of 500 divided by credits per run	25 runs/user maximum
Output status	Result category plus number of quality-assurance-passing outputs	Concept generated / 0 passed
Elapsed time	User-visible task time	1 minute 29 seconds

After repeated runs: add median credits per run, quality-assurance pass rate, and credits per usable output. Those measures are more decision-useful than a single-run dollar estimate.

Source basis: measured 20-credit and \$0.80 dashboard deltas for this run; 500-credit monthly allowance supplied by management. The dollar figure is the dashboard estimate and may not equal an incremental invoice charge. Draft pending ORNL content-owner and brand review.

Worked for 1m 29s >

CONVENTIONAL SYSTEM

MORE ELECTRICAL DISTURBANCES. MORE STRESS.

Higher electrical ripple
More component stress
Reduced efficiency

Charger → Batteries → Inverter → Motor

Higher component stress
Lower reliability
Faster wear on
Reduced lifespan

ORNL IMPROVED SYSTEM

TWO INVERTERS, OPPOSITE PHASE, A SMOOTHER RIDE.

Two inverters working in opposite phase to cancel unwanted effects

Charger → Batteries → Inverter 1 → Inverter 2 → Motor

Reduced component stress
Improved reliability
Longer system life
Smoother operation
Cleaner transportation

GREATER EFFICIENCY

HIGHER RELIABILITY

LONGER LIFE

SMOOTHER OPERATION

CLEANER TRANSPORTATION

ORNL

I produced one draft concept from the project brief, using a heavy-duty truck and the red-vs.-green system comparison requested.

The visual direction is useful as a starting point, but it **does not pass the production QA gate**: the generation introduced unauthorized extra benefit copy, slogans, footer text, and an ORNL-like logo treatment beyond the closed text inventory. The single allowed repair also failed to remove those additions, so I'm stopping rather than presenting it as brand-compliant finished artwork.

The concept itself is still worth carrying forward: two stacked truck/system views, red conventional ripple versus green opposing-phase inverter cancellation, with the charger → batteries → inverter(s) → motor flow shown visually. A next production pass should rebuild that concept with exact deterministic text handling and approved logo artwork, if the logo is meant to appear.
